FAMILY AMPHIZOIDAE
(Trout-stream beetles)

Y. Bousquet

The Amphizoidae is a small monogeneric family containing the genus Amphizoa with four species; three species occur in western North America, the remaining one in western Szechwan Province of the Peoples Republic of China. Both larvae and adults are found crawling over submerged rocks, debris or wood in rivers, fast flowing mountain streams or in waterfalls. They apparently feed on living stonefly nymphs.

Kavanaugh (1986) recently revised the species of this family.
