

FAMILY PROSTOMIDAE
(Prostomid beetles)

J.M. Campbell

This small family contains only two genera and about 20 species. Most faunal regions, except South America, have a few species of the family, and one species occurs in Canada. Nothing is known about the habitat of this species.

Prostomis americanus Crotch has been referred to as *P. mandibularis* (Fabricius), a European species, in most North American literature.
