

FAMILY SPHINDIDAE
(Dry fungus beetles)

J.M. Campbell

The Sphindidae is a small family comprising 35 species worldwide of which five are known from Canada. Adults and larvae feed on spores of slime molds.

The last revision of the North American sphindids is that of Casey (1898). The higher classification of the family was revised by Sen Gupta and Crowson (1977). The family is in need of a taxonomic revision and current records are unreliable.
